Requirements Analysis and Specification

Organization of this Lecture

- Brief review of previous lectures
- Introduction
- Requirements analysis
- Requirements specification
- SRS document
- Decision table
- Decision tree
- Summary

Requirements Analysis and Specification

- Many projects fail:
  - because they start implementing the system:
  - without determining whether they are building what the customer really wants.

Requirements Analysis and Specification

- It is important to learn:
  - requirements analysis and specification techniques thoroughly.

Requirements Analysis and Specification

- Goals of requirements analysis and specification phase:
  - fully understand the user requirements
  - remove inconsistencies, anomalies, etc. from requirements
  - document requirements properly in an SRS document

Requirements Analysis and Specification

- Consists of two distinct activities:
  - Requirements Gathering and Analysis
  - Specification

Requirements Analysis and Specification

- The person who undertakes requirements analysis and specification:
  - known as systems analyst:
  - collects data pertaining to the product
  - analyzes collected data:
    - to understand what exactly needs to be done.
  - writes the Software Requirements Specification (SRS) document.

Requirements Analysis and Specification

- Final output of this phase:
  - Software Requirements Specification (SRS) Document.
- The SRS document is reviewed by the customer.
  - reviewed SRS document forms the basis of all future development activities.

Requirements Analysis

- Requirements analysis consists of two main activities:
  - Requirements gathering
  - Analysis of the gathered requirements

Requirements Analysis

- Analyst gathers requirements through:
  - Studying the existing documentation
  - Interviewing the customer and end-users
  - Analysis of what needs to be done
    - Task Analysis
    - Scenario Analysis
  - Form analysis

Requirements Gathering

- If the project is to automate some existing procedures
  - e.g., automating existing manual accounting activities,
  - the task of the system analyst is a little easier
  - analyst can immediately obtain:
    - input and output formats
    - accurate details of the operational procedures

Requirements Gathering
(CONT.)

- In the absence of a working system,
  - lot of imagination and creativity are required.
- Interacting with the customer to gather relevant data:
  - requires a lot of experience.

Requirements Gathering
(CONT.)

- Some desirable attributes of a good system analyst:
  - Good interaction skills,
  - imagination and creativity,
  - experience.

Analysis of the Gathered Requirements

- After gathering all the requirements:
  - analyze it:
    - Clearly understand the user requirements,
    - Detect inconsistencies, ambiguities, and incompleteness.
- Incompleteness and inconsistencies:
  - resolved through further discussions with the end-users and the customers.

Inconsistent requirement

- Some part of the requirement:
  - contradicts with some other part.
  - Two end-users give inconsistent description of the requirement.
- Example:
  - One customer says turn off heater and open water shower when temperature > 100 C
  - Another customer says turn off heater and turn ON cooler when temperature > 100 C

Ambiguity / Anomaly

- Several interpretations of the requirement are possible
- Example:
  - If you are absent for long you won't be allowed for exams
  - If temperature becomes high, heater should be switched off
  - 'Long', 'high' are not defined: ambiguous

Incomplete requirement

- Some requirements have been overlooked:
  - Realized by the customer much later, possibly during usage
- Example:
  - The analyst has not recorded: when temperature falls below 90 C
    - heater should be turned ON
    - water shower turned OFF.

Analysis of the Gathered Requirements (CONT.)

- Requirements analysis involves:
  - obtaining a clear, in-depth understanding of the product to be developed,
  - remove all ambiguities and inconsistencies from the initial customer perception of the problem.

Analysis of the Gathered Requirements (CONT.)

- It is quite difficult to obtain:
  - a clear, in-depth understanding of the problem:
    - especially if there is no working model of the problem.

Analysis of the Gathered Requirements (CONT.)

- Experienced analysts take considerable time:
  - to understand the exact requirements the customer has in his mind.

Analysis of the Gathered Requirements (CONT.)

- Experienced systems analysts know -
  often as a result of painful experiences ---
  - without a clear understanding of the problem, it is impossible to develop a satisfactory system.

Analysis of the Gathered Requirements(CONT.)

- Several things about the project should be clearly understood by the analyst, in order to gain a good grasp of the problem:
  - What is the problem?
  - Why is it important to solve the problem?
  - What are the possible solutions to the problem?
  - What complexities might arise while solving the problem?

Analysis of the Gathered Requirements(CONT.)

- Some anomalies and inconsistencies can be very subtle:
  - escape even most experienced eyes.
  - If a formal model of the system is constructed,
    - many of the subtle anomalies and inconsistencies get detected.

Analysis of the Gathered Requirements(CONT.)

- After collecting all data regarding the system to be developed,
  - remove all inconsistencies and anomalies from the requirements,
  - systematically organize requirements into a Software Requirements Specification (SRS) document.

Software Requirements Specification

- Main aim of requirements specification:
  - systematically organize the requirements arrived during requirements analysis
  - document requirements properly.

Software Requirements Specification

- The SRS document is useful in various contexts:
  - Statement of user needs
  - Contract document
  - Test document
  - Goals of implementation

Software Requirements Specification: A Contract Document

- Requirements document is a reference document.
- SRS document is a contract between the development team and the customer.
  - Once the SRS document is approved by the customer,
    - any subsequent controversies are settled by referring the SRS document.

Software Requirements Specification: A Contract Document

- Once customer agrees to the SRS document:
  - development team starts to develop the product according to the requirements recorded in the SRS document.
- The final product will be acceptable to the customer:
  - as long as it satisfies all the requirements recorded in the SRS document.

SRS Document (CONT.)

- The SRS document is known as black-box specification:
  - the system is considered as a black box whose internal details are not known.
  - only its visible external (i.e. input/output) behavior is documented.

SRS Document (CONT.)

- SRS document concentrates on:
  - what needs to be done
  - carefully avoids the solution ("how to do") aspects.
- The SRS document serves as a contract
  - between development team and the customer.
  - Should be carefully written

SRS Document (CONT.)

- The requirements at this stage:
  - written using end-user terminology.
- If necessary:
  - later a formal requirement specification may be developed from it.

Properties of a good SRS document

- It should be concise
  - and at the same time should not be ambiguous.
- It should specify what the system must do
  - and not say how to do it.
- Easy to change.,
  - i.e. it should be well-structured.

Properties of a good SRS document (cont...)

- It should be traceable
  - you should be able to trace which part of the specification corresponds to which part of the design and code, etc and vice versa.
- It should be verifiable
  - e.g. "system should be user friendly" is not verifiable

SRS Document Organization

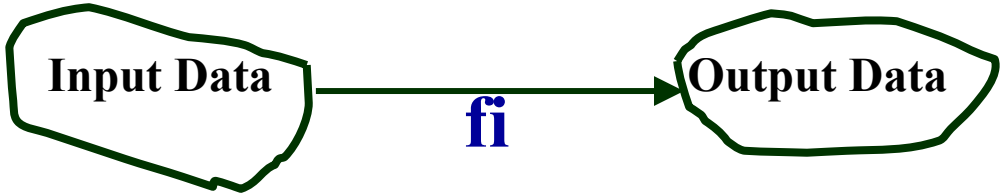
- Introduction
  - Purpose
  - Overview
- Goals of Implementation
- **Functional Requirements**
  - **Functional Requirement 1**
  - **Functional Requirement 2**
  - **…**
- **Non-Functional Requirements**
  - **External Interfaces**
  - **User Interfaces**
  - **Software Interfaces**
  - **Performance**

SRS Document (CONT.)

- SRS document, normally contains three important parts:
  - functional requirements,
  - nonfunctional requirements,
  - constraints.

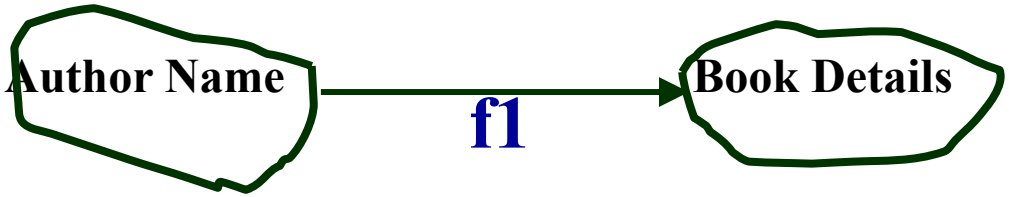
SRS Document (CONT.)

- It is desirable to consider every system:
  - performing a set of functions {fi}.
  - Each function fi considered as:
  - transforming a set of input data to corresponding output data.



Example: Functional Requirement

- F1: Search Book
  - Input:
    - an author's name:
  - Output:
    - details of the author's books and the locations of these books in the library.



Functional Requirements

- Functional requirements describe:
  - A set of high-level requirements
  - Each high-level requirement:
    - takes in some data from the user
    - outputs some data to the user
  - Each high-level requirement:
    - might consist of a set of identifiable functions

Functional Requirements

- For each high-level requirement:
  - every function is described in terms of
    - input data set
    - output data set
    - processing required to obtain the output data set from the input data set

Nonfunctional Requirements

- Characteristics of the system which can not be expressed as functions:
  - maintainability,
  - portability,
  - usability, etc.

Nonfunctional Requirements

- Nonfunctional requirements include:
  - reliability issues,
  - performance issues,
  - human-computer interface issues,
  - Interface with other external systems,
  - security, maintainability, etc.

Constraints

- Constraints describe things that the system should or should not do.
  - For example,
    - standards compliance
    - how fast the system can produce results
      - so that it does not overload another system to which it supplies data, etc.

Examples of constraints

- Hardware to be used,
- Operating system
  - or DBMS to be used
- Capabilities of I/O devices
- Standards compliance
- Data representations
  - by the interfaced system

Organization of the SRS Document

- Introduction.
- Functional Requirements
- Nonfunctional Requirements
  - External interface requirements
  - Performance requirements
- Constraints

Example Functional Requirements

- List all functional requirements
  - with proper numbering.
- Req. 1:
  - Once the user selects the "search" option,
    - he is asked to enter the key words.
  - The system should output details of all books
    - whose title or author name matches any of the key words entered.
    - Details include: Title, Author Name, Publisher name, Year of Publication, ISBN Number, Catalog Number, Location in the Library.

Example Functional Requirements

- Req. 2:
  - When the "renew" option is selected,
    - the user is asked to enter his membership number and password.
  - After password validation,
    - the list of the books borrowed by him are displayed.
  - The user can renew any of the books:
    - by clicking in the corresponding renew box.

Req. 1:

- R.1.1:
  - Input: "search" option,
  - Output: user prompted to enter the key words.
- R1.2:
  - Input: key words
  - Output: Details of all books whose title or author name matches any of the key words.
    - Details include: Title, Author Name, Publisher name, Year of Publication, ISBN Number, Catalog Number, Location in the Library.
  - Processing: Search the book list for the keywords

Req. 2:

- R2.1:
  - Input: "renew" option selected,
  - Output: user prompted to enter his membership number and password.
- R2.2:
  - Input: membership number and password
  - Output:
    - list of the books borrowed by user are displayed. User prompted to enter books to be renewed or
    - user informed about bad password
  - Processing: Password validation, search books issued to the user from borrower list and display.

Req. 2:

- R2.3:
  - Input: user choice for renewal of the books issued to him through mouse clicks in the corresponding renew box.
  - Output: Confirmation of the books renewed
  - Processing: Renew the books selected by the in the borrower list.

Examples of Bad SRS Documents

- Unstructured Specifications:
  - Narrative essay --- one of the worst types of specification document:
    - Difficult to change,
    - difficult to be precise,
    - difficult to be unambiguous,
    - scope for contradictions, etc.

Examples of Bad SRS Documents

- Noise:
  - Presence of text containing information irrelevant to the problem.
- Silence:
  - aspects important to proper solution of the problem are omitted.

Examples of Bad SRS Document

- Overspecification:
  - Addressing "how to" aspects
  - For example, "Library member names should be stored in a sorted descending order"
  - Overspecification restricts the solution space for the designer.
- Forward References:
  - References to aspects of problem
    - defined only later on in the text.
- Wishful Thinking:
  - Descriptions of aspects
    - for which realistic solutions will be hard to find.

Representation of complex processing logic:

- Decision trees
- Decision tables

Decision Trees

- Decision trees:
  - edges of a decision tree represent conditions
  - leaf nodes represent actions to be performed.
- A decision tree gives a graphic view of:
  - logic involved in decision making
  - corresponding actions taken.

Example: LMS

- A Library Membership automation Software (LMS) should support the following three options:
  - new member,
  - renewal,
  - cancel membership.

Example: LMS

- When the new member option is selected,
  - the software asks details about the member:
    - name,
    - address,
    - phone number, etc.

Example(cont.)

- If proper information is entered,
  - a membership record for the member is created
  - a bill is printed for the annual membership charge plus the security deposit payable.

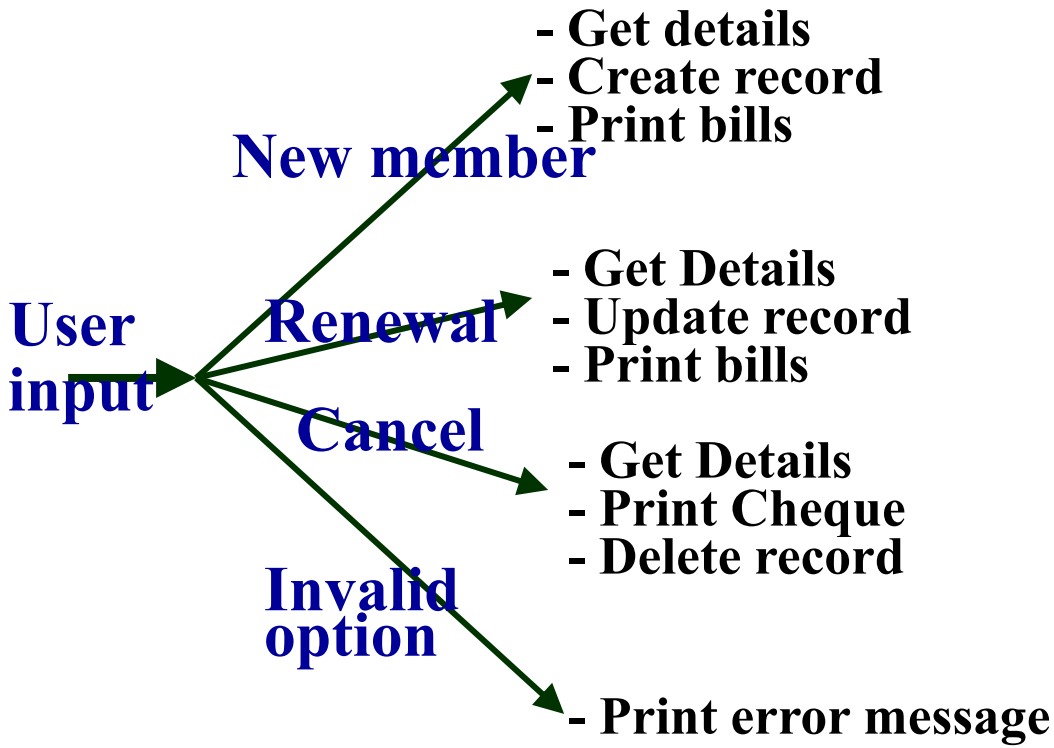
Example(cont.)

- If the renewal option is chosen,
  - LMS asks the member's name and his membership number
    - checks whether he is a valid member.
  - If the name represents a valid member,
    - the membership expiry date is updated and the annual membership bill is printed,
    - otherwise an error message is displayed.

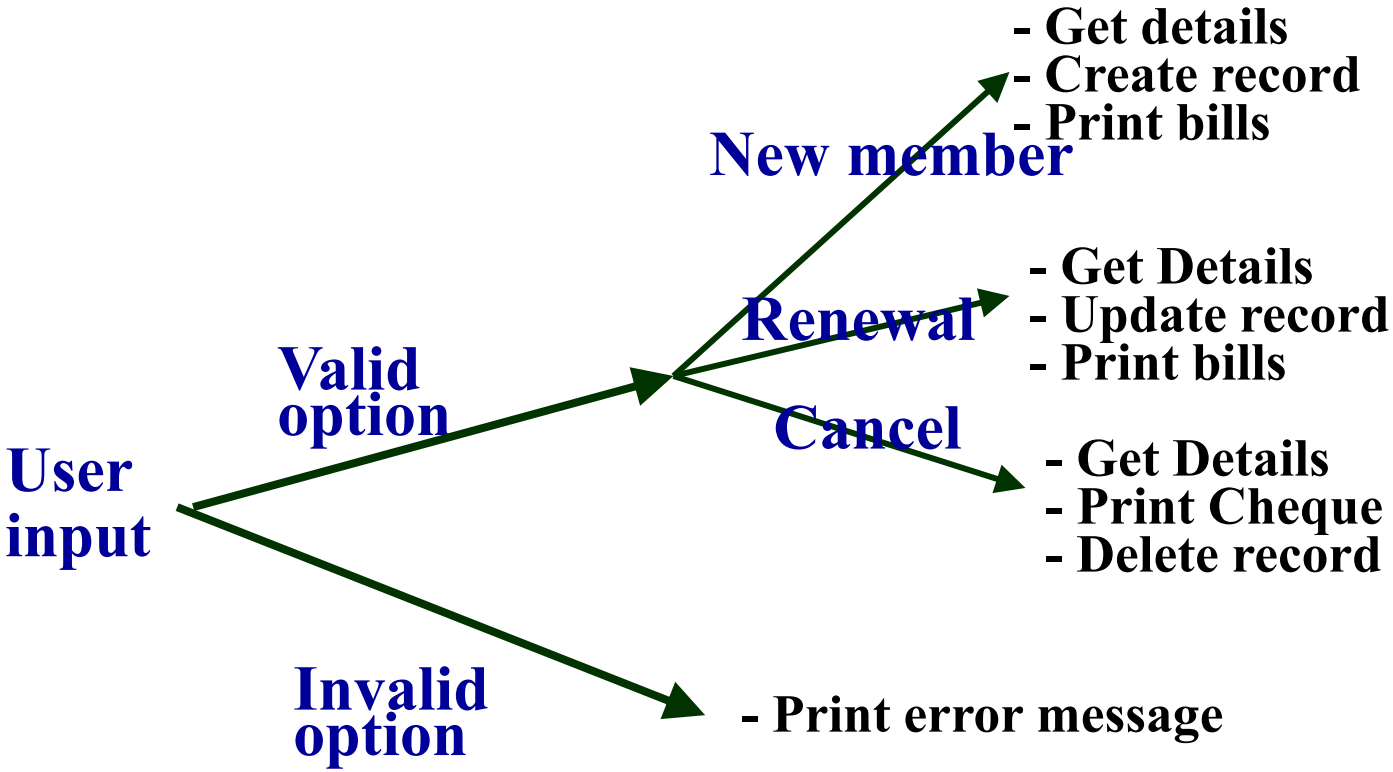
Example(cont.)

- If the cancel membership option is selected and the name of a valid member is entered,
  - the membership is cancelled,
  - a cheque for the balance amount due to the member is printed
  - the membership record is deleted.

Decision Tree



Decision Tree



Decision Table

- Decision tables specify:
  - which variables are to be tested
  - what actions are to be taken if the conditions are true,
  - the order in which decision making is performed.

Decision Table

- A decision table shows in a tabular form:
  - processing logic and corresponding actions
- Upper rows of the table specify:
  - the variables or conditions to be evaluated
- Lower rows specify:
  - the actions to be taken when the corresponding conditions are satisfied.

Decision Table

- In technical terminology,
  - a column of the table is called a rule:
  - A rule implies:
    - if a condition is true, then execute the corresponding action.

Example:

- Conditions

Valid selection	NO	YES	YES	YES
New member	--	YES	NO	NO
Renewal	--	NO	YES	NO
Cancellation	--	NO	NO	YES

- Actions

Display error message	⊗			
Ask member's name etc.		⊗		
Build customer record		⊗		
Generate bill		⊗	⊗	
Ask membership details			⊗	⊗
Update expiry date			⊗	
Print cheque				⊗
Delete record				⊗

Comparison

- Both decision tables and decision trees
  - can represent complex program logic.
- Decision trees are easier to read and understand
  - when the number of conditions are small.
- Decision tables help to look at every possible combination of conditions.

Comparison

- Order of decision making is abstracted out in decision tables
  - Decision trees support multi-level or hierarchical decision making
- Decision tables are appropriate where very large number of decisions is involved
  - Decision trees become complex

Formal Specification

- A formal specification technique is a mathematical method to:
  - accurately specify a system
  - verify that implementation satisfies specification
  - prove properties of the specification

Formal Specification

- Advantages:
  - Well-defined semantics, no scope for ambiguity
  - Automated tools can check properties of specifications
  - Executable specification

Formal Specification

- Disadvantages of formal specification techniques:
  - Difficult to learn and use
  - Not able to handle complex systems

Formal Specification

- Mathematical techniques used include:
  - Logic-based
  - set theoretic
  - algebraic specification
  - finite state machines, etc.

Semiformal Specification

- Structured specification languages
  - SADT (Structured Analysis and Design Technique)
  - PSL/PSA (Problem Statement Language/Problem Statement Analyzer)
    - PSL is a semi-formal specification language
    - PSA can analyze the specifications expressed in PSL

Executable Specification Language

- If specification is expressed in formal language:
  - it becomes possible to execute the specification to provide a system prototype.
- However, executable specifications are usually slow and inefficient.

Executable Specification Language

- Executable specifications only test functional requirements:
  - If non-functional requirements are important for some product,
    - the utility of an executable specification prototype is limited.

4GLs

- 4GLs (Fourth Generation Languages) are examples of
  - executable specification languages.
- 4GLs are successful
  - because there is a lot of commonality across data processing applications.

4GLs

- 4GLs rely on software reuse
  - where common abstractions have been identified and parameterized.
- Rewriting 4GL programs in higher level languages:
  - result in upto 50% lower memory requirements
  - also the programs run upto 10 times faster.

Summary

- Requirements analysis and specification
  - an important phase of software development:
  - any error in this phase would affect all subsequent phases of development.
- Consists of two different activities:
  - Requirements gathering and analysis
  - Requirements specification

Summary

- The aims of requirements analysis:
  - Gather all user requirements
  - Clearly understand exact user requirements
  - Remove inconsistencies and incompleteness.
- The goal of specification:
  - systematically organize requirements
  - document the requirements in an SRS document.

Summary

- Main components of SRS document:
  - functional requirements
  - nonfunctional requirements
  - constraints
- Techniques to express complex logic:
  - Decision tree
  - Decision table

Summary

- Formal requirements specifications have several advantages.
  - But the major shortcoming is that these are hard to use.
